Weininger,S. and Weininger,A.M.
Weininger,S. and Weininger,A.M.
Sequence-specific detection of nucleic acid hybrids using a
DNA-binding molecule or assembly capable of discriminating perfect
hybrids from non-perfect hybrids
Patent: US 5871902-A 29 16-FEB-1999;

Weininger,S. and Weininger,A.M.
Sequence-specific detection of nucleic acid hybrids using a
Sequence-specific detection of nucleic acid hybrids molecule or assembly capable of discriminating perfect
hybrids from non-perfect hybrids
Patent: US 5871902-A 27 16-FEB-1999;

weininger, S. and Weininger, A.M.
Sequence-specific detection of nucleic acid hybrids using a
Squence-specific detection of samply capable of discriminating perfect
hybrids from non-perfect hybrids
Patent: US 5871902-A 26 16-FEB-1999;
Location/Qualifiers
                                                                                                                                       van Lint,C., Burny,A., Quivy,V. and Adam,E.
Method for obtaining the elimination of integrated and functional
viruses from infected mammal cells
Patent: WO 3053468-A 2 03-JUL-2003,
UNIVERSITE LIBRE DE BRUXELLES (BE)

Weininger,S. and Weininger,A.M.
Sequence-specific detection of nucleic acid hybrids using a
Sequence-specific detection of specific acid hybrids molecule or assembly capable of discriminating perfect
hybrids from non-perfect hybrids
Patent: US 5871902-A 25 16-FEB-1999;

Composition useful for the treatment of immune and inflammatory diseases, cancer and viral infections.

Claim 1; Col 4; 14pp; English.

This sequence represents the kappa-B-PT sequence (SEQ ID 2) which contains three immunoglobulin kappa-B sequences (AAZ12918) which are contains three immunoglobulin kappa-B sequences (AAZ12918) which are bound by activated NF-kappa-B (nuclear factor kappa-B). It can inhibit NF-kappa-B binding to endogenous kappa-B enhancer/promoter elements, thus inhibiting transcription of genes that comprise such elements. NF-kappa-B is involved in the induction of cell adhesion associated with NF-kappa-B confiderentiation or activation. For example, the human promyelotic leukaemia cell line (HL-60 cells) can be induced to differentiate into monocytoid cells with concomitant expression of the leukocyte adhesion of paper concomitant with phorbol esters. However, this cappace of muchant kappa-B-PT sequence (AAZ12920) had no effect on differentiation and adhesion compositions containing the kappa-B-PT sequence may be used for the treatment of immune and inflammatory diseases, cancer and viral infections. In particular it can be used to transplant rejection, Crohn's disease, ulcerative colitis, psoriasis, transplant rejection, Crohn's disease, ulcerative colitis, psoriasis, elliv, collicial per persential may be used for the beneaved a further addition and adhesion containing the kappa-B-PT sequence may be used for the treatment of immune and inflammatory diseases, cancer and viral infections. In particular it can be used to transplant rejection, Crohn's disease, ulcerative colitis, psoriasis, containing the kappa virus infections and reaction to poison ivy, poison oak and poison sumac

The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acid. The immunostimulatory nucleic acids can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Thi immune response and to activate immune cells. Note: the

Also included is a kit comprising a first container housing the antiangiogenic nucleic acids, and instructions for administering them to a subject having a condition characterised by unwanted angiogenesis. The method is useful for inhibiting angiogenesis associated with solid tumour growth, tumour metastasis, precancerous lesion, rheumatoid arthritis, psoriasis, diabetic retinopathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental fibroplasia, rubeoals, osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, intestinal adhesions, atherosclerosis, scleroderma and hypertrophic scars. The present sequence is an antiangiogenic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                             Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention describes a method of treating non-allergic inflammatory disease comprising administering to a subject having or at risk of developing a non-allergic inflammatory disease an immunostimulatory nucleic acid for prevention or treatment of the disease. The method is useful for treating non-allergic inflammatory diseases, such as psoriasis, eczema, allergic context dermatitis, latex dermatitis or inflammatory bowel disease e.g., ulcerative colitis or Crohn's disease. This sequence represents an immunostimulatory nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                            Treating non-allergic inflammatory diseases, such as psoriasis, eczo allergic contact dermatitis, latex dermatitis or inflammatory bowel disease by administering an immunostimulatory nucleic acid.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, brain and central nervous system (CNS) cancer, breast cancer, brain and central nervous system (CNS) cancer, breast cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, oesophageal cancer, eye cancer, kidney cancer, larynax cancer, leukaemia, liver cancer, lung cancer, Hodgkin's lymphoma, melanoma, myeloma, oral cavity cancer, ovarian cancer, prostete cancer, rhabdomyosarcoma, skin cancer, testicular cancer, rhabdomyosarcoma, skin cancer, testicular cancer, and uterine cancer. The present sequence is an immunostimulatory oligonucleotide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to methods for treating or preventing cancer, involving administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Treating or preventing cancer, such as basal cell carcinoma, comprises administering immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies to a subject having or at risk of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Suppressing allergies, including asthma, rhinitis, urticaria and atopic dermatitis, in a subject, comprises administering a first and second dose of an immunostimulatory nucleic acid.
                                                       The invention relates to a method of treating or preventing allergy or asthma which comprises administering to a subject a poly-G nucleic acid in an aerosol formulation. The methods and compositions of the present invention are useful for diagnosing and/or treating asthma and allergy especially in a hypo-respondive subject. The present sequence represents an immunostimulatory nucleic acid of the invention.
nucleic acid alone or in combination with an asthma/allergy medicament
                                                                                                                                                                                                                       Gaps

The invention relates to a method of suppressing a symptom of an allergic response in a subject by administering a first and second dose of an immunostimulatory nucleic acid that comprises a nucleotide sequence comprising 5'-cg-3', and where the second dose is administered from 1 day present invention are useful for the treatment or prevention of asthma and allergy, including rhinitis, urricaria and atopic dermatitis, using an immunostimulatory nucleic acid alone or in combination with other medicaments. They can also be used in preventing bacterial and viral infections. This sequence represents an oligonucleotide used in the method of the invention.

AAT30581-T30614 represent target binding regions (TBR) of a probe of the invention. The probe of the invention contains a TBR, a booster binding cregion (BBR), and an optional support or attachment (OSA). The target binding assembly (TBA) recognised by the probe, contains at least one nucleic acid recognition unit (NAR) and optionally a linker sequence, an assembly sequence (see AAR95994-R95998), an asymmetry sequence (see AAR95007), and an OSA. The assembly sequence and asymmetry sequence (see AAR95099) are selected from NF-kappa B, SPI, TATA, human papillomavirus (HPV) E2, HPV LTR, human immunodeficiency virus (HIV) LTR and Tat binding units. The linker sequence is an oligopeptide, which does not interfere with NAR function, but provides stability and control over the spacing of the NAR from the rest of the TBA. The OSA is an attached support or indicator, or other means of localisation of the probe. The probe can be used in a method for detecting or localisation a specific target nucleic acid sequence (TNA). The method is highly sensitive, and has a high acid sequence of specificity. The method can be used for detecting specific canded sequences, including those found in human calls, in HIV, HIV, and other nucleic acid containing systems, including bacteria and

AAT30581-T30614 represent target binding regions (TBR) of a probe of the invention. The probe of the invention contains a TBR, a booster binding region (BBR), and an optional support or attachment (OSA). The target binding assembly (TBA) recognised by the probe, contains at least one nucleic acid recognition unit (NAR) and optionally a linker sequence, assembly sequence (See AAR95994-R95999), an asymmetry sequence (See AAR95007), and an OSA. The assembly sequence and asymmetry sequence (See AAR95099-R95999) are selected from NF-kapae. The NAR8 (See AAR95007), and an OSA. The assembly sequence and asymmetry sequence are responsible (For the foliding and association of the NAR8. THE NAR8 (See AAR95007). The foliding and association of the NAR8. THE NAR8 (See AAR95007) are selected from NF-kapae. S. S. TATA, human papillomavirus (HPV) E2, HPV LTR, human immunodeficiency virus (HTV) LTR and Tat binding the NAR function, but provides stability and control over the spacing of the NAR from the rest of the TBA. The OSA is an attached support or indicator, or other means of localisation of the probe. The probe can be used in a method for detecting or localising a specific target nucleic acid sequence (TNAA). The method is highly sensitive, and has a high acid sequences, including those found in human cells, in HTV, HPV, and other nucleic acid containing systems, including bacteria and

The sequences given in AAQ58049-50 form a double stranded DNA molecule which was used as the cargo moiety in the conjugate of the invention. This oligonuclectide fragment was linked to a peptide fragment of the HIV tat protein which was used as transport moieties. These conjugates are used as cargo molecules for the efficient cytoplasmic and nuclear molecules which are not inherently capable of entering a target cell. The tat basic region amino acid sequence carries cargo molecules by covalent attachment. The reduced size of the transport peptides minimises attachment, the shological activity of the cargo molecule. By virtue of the absence of the cyteline-rich region (residues 22-36) of the tat protein, problems of spurious trans- estivation and disulphide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                     Transport of cargo moieties into cells - using genetic fusions of chemical conjugates comprising a portion of HIV tat protein as transport
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         aggregation are solved. The reduced transport peptide size also enhances uptake efficiency. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                            The sequences given in AAQS8049-50 form a double stranded DNA molecule which was used as the cargo molety in the conjugate of the invention. This oligonucleotide fragment was linked to a peptide fragment of the HIV tat protein which was used as transport moieties. These conjugates are used as cargo molecules for the efficient cytoplasmic and nuclear delivery of biologically active non-tat proteins, nucleic acids and other molecules which are not inherently capable of entering a target cell. The tat basic region amino acid sequence carries cargo molecules by covalent attachment. The reduced size of the transport peptides minimises interference with the biological activity of the cargo molecule. By virtue of the absence of the cysteine-rich region (residues 22-36) of the aggregation are solved. The reduced transport peptide size also enhances uptake efficiency. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                              Transport of cargo moieties into cells - using genetic fusions of chemical conjugates comprising a portion of HIV tat protein as transport peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

```

```
This double-stranded DNA sequence, comprising oligonucleotides NF1 (sense strand) and NF2 (antisense strand). corresponds to the wild-type NF-kappa B binding site. It was used in the preparation of transport polyperide. DNA conjugates. Such conjugates, in which modified HIV tat protein is used as transport polypeptide, can be used to deliver cargo molecules to cells in vivo or in vitro. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                          New DNA constructs for transporting molecules to cells - encode a fusion protein comprising a modified HIV tat protein and a carboxy-terminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chemical conjugate; transport polypeptide; tat protein; nucleic acid; delivery; cytoplasm; cell nucleus; therapy; prophylaxis; diagnosis; spurious transactivation; HIV-1; disulphide aggregation; NF-kappaB; inhibition; NF2; human immundeficiency virus type 1; transcriptional activation; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઠ
                                                                                                                                                                                                                                                                                                          polypeptide moiety consisting of at least residues 49-57 of human collypeptide moiety consisting of at least residues 49-57 of human collypeptide moiety consisting of at least residues 49-57 of human collypeptide moiety with (HIV) tat protein, but not residues 22-36 and 73-86, and a cargo moiety emprising a single or double stranded nucleic acid, e.g. the present sequence. The conjugate can be used to deliver cargo moieties into the cytoplasm and nuclei of cells for therapeutic, prophylactic and diagnostic applications. In an example conjugates to inhibit transcriptional activation by NF-kappab were prepared, the corresponding to the wild type NF-KB binding site, while NF2 and NF4 form a duplex corresponding to a muteant NF-KB binding site, while NF2 and NF4 form a duplex corresponding to a muteant NF-KB binding site. Traut modified NF1 was annealed with NF2, and Traut modified NF3 annealed with NF4. The DNA was the reacted with bismaledinidohexane activated tat 32-72. The products were tested as in Science 250, 997-1000 (1990) for inhibition of NF-KB transcriptional activation. The results showed that the tat cransport polypeptides minimises interference with the protein is readily taken up into cells and the cell nucleus. The reduced size of the transport polypeptides minimises interference with the absence of the cysteine rich region of the HIV tat protein, the transport collypeptides solve the protein in the ready molecule. In addition, by virtue of the cause of the cause of the cysteine rich region of the HIV tat protein, the transport of disulphide aggregation (Updated on 25-MR-2003 to correct PF field.)

A novel covalently linked chemical conjugate, comprises a transport conjugation of at least residues 49-57 of human immunodeficiency virus (HIV) tat protein, but not residues 22-36 and 73-68, and a cargo moiety comprising a single or double stranded nucleic acid, e.g. the present sequence. The conjugate can be used to deliver cargo moieties into the cytoplasm and nuclei of cells for therapeutic, prophylactic and diagnostic applications. In an example conjugates to inhibit transcriptional activation by NF-kappaB were prepared, the climbibit transcriptional activation by NF-kappaB were prepared, the oligomucleotides used were NF1-4 (AATSB239-42). NF1 and NF2 for a duplex corresponding to the wild type NF-KB binding site, while NF2 and NF4 form a duplex corresponding to a muteant NF-KB binding site, while NF2 and NF4 form a duplex corresponding to a muteant NF-KB binding site. Traut modified NF1 was annealed with NF2, and Traut modified NF3 annealed with NF4. The DNA was the reacted with bismaleimidohexane activated tat 32-72. The cransport polypeptide significantly enhanced that the tat cransport polypeptides minimises interference with the correct protein is readily taken up into cells and the cell nucleus. The reduced size of the transport polypeptides minimises interference with the collectivity of the cargo molecule. In addition, by virtue of the biological activity of the cargo molecule. In addition, by virtue of the cargo molecule. In a cargo molecule of the cargo molecule. In addition of the cargo molecule. In
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Conjugate for intracellular delivery - comprising transport moiety having amino acids 49-57 of human immunodeficiency virus tat protein and nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              .

This oligonuclectide primer is used with AAR89779 to form a duplex corresponding to the wild type transcription factor NP-kappaB binding site which is used in the construction of a transport polypeptide-DNA conjugate. This conjugate is used in a novel method for delivery of biologically active cargo molecules into the cytoplasm and nuclei of eukaryotic cells. The tat protein from immunodeficiency virus (e.g. HIV-LY, SIV) is readily taken up into cells when present e.g. taracellularly and can be modified to covalently link to cargo proteins centracellularly and can be modified to covalently link to cargo proteins problems of spurious trans-activation and disulphide aggregation. These transport polypeptides also minimise interference with the biological activity of the cargo molecule. This is applicable for therapeutic, prophylactic or diagnostic intracellular delivery of small molecules and macromolecules e.g. proteins, nucleic acids and polysaccharides.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This oligonucleotide primer is used with AAT89780 to form a duplex corresponding to the wild type transcription factor NP-kappaB binding site which is used in the construction of a transport polypeptide-DNA conjugate. This conjugate is used in a novel method for delivery of biologically active cargo molecules into the cytoplasm and nuclei of eukaryotic cells. The tat protein from immunodeficiency virus (e.g. HIV-1, SIV) is readily taken up into cells when present extracellularly and can be modified to covalently link to cargo proteins extracellularly and can be modified to covalently link to cargo proteins problems of spurious trans-activation and disulphide aggregation. These transport polypeptides also minimise interference with the biological activity of the cargo molecule. This is applicable for therapeutic, prophylactic or diagnostic intracellular delivery of small molecules and macromolecules e.g. proteins, nucleic acids and polysaccharides. This sequence is a phosphorothioate primer used in a method for the delivery of biologically active cargo molecules into the cytoplasm and muclei of cells, for therapeutic, prophylactic or diagnostic purposes.

This is accomplished by the presence of a small, basic section of the tat transport protein from human immunodeficiency virus (HIV) Type I. This is cused as it is this protein which is observed to cause human cells in culture to take up HIV. The method involves the use of a cargo moiety in combination with a transport moiety usually in the form of a fusion combination with a transport moiety usually in the form of a fusion combination with a transport moiety usually in the form of a fusion cretains its biological activity after delivery into a target cell and where the transport moiety is one of following HIV tat protein fragments cretains its biological activity after delivery into a target cell and where the transport moiety is one of following HIV tat protein fragments concertify proposed into cells at high concentrations due to use of specific peptides into cells at high concentrations due to use of existing transporters. Previous methods of delivery include bombardment and transforming, which only allow a fraction of the cell population to be infected and can additionally damage cells as they cause physical companing of the cell walls/membranes to allow entry. (Updated on 25-MAR-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       HIV tat-derived transport fusion proteins - used to deliver biological active molecules e.g. peptide(s) or nucleic acids, specifically into cytoplasm or nuclei of cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence is a phosphorothioate primer used in a method for the delivery of biologically active cargo molecules into the cytoplasm and nuclei of cells, for therapeutic, prophlactic or diagnostic purposes.

This is accomplished by the presence of a small, basic section of the transport protein from human immunodeficiency virus (HIV) Type I. This is used as it is this protein which is observed to cause human cells in culture to take up HIV. The method involves the use of a cargo moiety is combination with a transport moiety usually in the form of a fusion protein. The cargo moiety is a human papillomavirus E2 repressor that retains its biological activity after delivery into a target cell and where the transport moiety is a human papillomying HIV tat protein fragments of a a 47-58, (b) as 47-62, (c) 38-72, (d) as 38-58, (e) as 37-58, (f) as 12-1 and 38-72, (g) as 47-62 or as 38-62. The proteins allow delivery of specific peptides into cells at high concentrations due to use of existing transporters. Previous methods of delivery include bombardment and transforming, which only allow a fraction of the cell population to be infected and can additionally damage cells as they cause physical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HIV tat-derived transport fusion proteins - used to deliver biological active molecules e.g. peptide(s) or nucleic acids, specifically into cytoplasm or nuclei of cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

```
The invention relates to a method for delivering a biologically active cargo molecule of interest into a cell. The method comprises presenting to the cell an extracellular fusion protein or a covalently linked conjugate consisting of a cargo moiety and a transport moiety having amino acids 49-57 of human immunodeficiency virus (HIV) transactivator (tat) protein and lacking amino acids 22-36 and 73-86 of HIV tat protein. The method is useful for delivering a molecule of interest such as polypeptides, antigen, monoclonal antibody, single- or double-stranded conclete acid, a therapeutic, prophylactic and diagnostic molecule to a cell in vitro or in vivo. The method delivers proteins or peptides, including regulatory factors, enzymes, drugs or toxins into the cytoplasm of cell nucleus. The method is useful for diagnostic, prophylactic or therapeutic intracellular delivery of small and macro molecules. The present sequence is a phosphorothiate oligonucleotide used for generating nuclear factor kappa B (NFKB) wild type binding site used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Delivering biologically active cargo molecules such as polypeptides, nucleic acids into cells by using transport polypeptides which comprise human immunodeficiency virus transactivator protein linked to cargo

The invention relates to a method for delivering a biologically active cargo molecule of interest into a cell. The method comprises presenting to the cell an extracellular fusion protein or a covalently linked conjugate consisting of a cargo moiety and a transport moiety having amino acids 49-57 of human immunodeficiency virus (HIV) transactivator (tat) protein and lacking amino acids 22-36 and 73-86 of HIV tat protein. The method is useful for delivering a molecule of interest such as polypeptides, antigen, monoclonal antibody, single- or double-stranded cucleic acid, a therapeutic, prophylactic and diagnostic molecule to a cell in vitro or in vivo. The method delivers proteins or peptides, including regulatory factors, enzymes, drugs or toxins into the cytoplasm and cell nucleus. The method is useful for diagnostic, prophylactic or herapeutic intracellular delivery of small and macro molecules. The therapeutic intracellular delivery of small and macro molecules. The cores present sequence is a phosphorothiate oligonucleotide used for generating nuclear factor kappa B (NFKB) wild type binding site used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           which comprise

The invention relates to a mixture comprising one or more triterpene glycosides isolated from Acacia victoriae. The composition is used for the treatment of cancer, inhibiting the initiation and promotion of mammalian epithelial cells (such as skin, colon, uterine, ovarian, pancreatic, prostate, renal, lung, bladder or breast cells), for preventing the abnormal profileration of mammalian epithelial cells (such as crypt or colon cells), and/or regulating angiogenesis. The triterpene glycosides may also be used as solvent, an antioxidant, antifungal or antiviral agent, piscicide, molluscicides, contraceptive, antihelmintic, angiogenesis regulator, UV-protectant, expectorant, diuretic, anti-inflammatory agent, regulator of cholesterol metabolism, cardiovascular effecter, anti-ulcer agent, analgesic, sedative, immunomodulator, combating the effects of aging, increasing skin collagen, enhancing penile function and improving cognition and memory. The present sequence represents an integral of a contraction and improving cognition and memory. The present sequence represents and integral of a contraction and improving cognition and memory. The present sequence represents and contraction and improving cognition and memory.
